/note="Organ: seedlings inoculated with Gluconacetobacter diazotroficans; Vector: pSportl, Site 1: Sall, Site 2:
Notl, An unidirectional cDNA library generated from lesedlings inoculated with Gluconacetobacter diazotroficans] cDNA was prepared from polyA+ mRNA using Supersoript Plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose CL-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details

(lone=long): Vector: pSport1; Site_1: Sal1; Site_2: Not1;
An unidirectional cDNA library generated from
[Inflorescence at begining of development (lcm-long)].
CDNA was prepared from polyA+ mRNA using SuperScript
Plasmid System Kit (Invitrogen). The double-strand cDNAs
were fractionated in a sepharose CL-2B 40cm-columns and
fragments sizing between 0.8 and 1.5 Kb were
directionally cloned into the vector. Details of each
source of RNA and library construction can be obtained at

or Neisseria meningitidis antigen, highly conserved between different strains - useful for prodn. of antibodies for immunisation against, diagnosis of, N. meningitidis infection.

Claim 7; Fig 1; 117pp; English.

A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39019) to AAT39040). The isolated 22 kD antigen, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in

```
meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)

N-PSDB; ACA64711

A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis T cells and antigen presenting cells.

Disclosure; Page; 167pp; English.

treatment of cancer, which binds to tumour associated lipids and induces anergy or apoptosis in the T cells and antigen presenting cells (APCs). Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tumour associated lipids and induces cellular inactivation or death is deleted or functionally deactivated, producing (MI) a tumouricidal immunocyte population in vivo in a mammal (by allowing tumour associated lipids to contact immunocytes in which receptors for immunosuppressive fatty acids, ceramides, glycolipids, sphingolipids, glycosphingolipids, phosphosphingolipids, gangliosides, The invention relates to a mammalian cell receptor, useful in the

Contect Aproximated approaches and proceedy. Totaling a superantigen (SAg) nucleotide inserted into a virus, a mammalian T cell useful in the treatment of cancer comprising a superantigen (SAg) nucleotide inserted into a virus, a mammalian T cell useful in the treatment of cancer (where an adaptor protein which inhibits T cell activation by tumour associated antigens is deleted or functionally deactivated) a composition useful in the treatment of cancer (comprising a lipid raft conjudated to a superantigen), producing allowing tumour associated lipids to contact immunocytes, in which receptors for the lipids are inactivated or deleted to produce a tumouricidal Apr contact Aprs, in which receptors for the tumour associated lipids to contact Aprs, in which receptors for the tumour associated lipids are transfirated or deleted to produce a tumouricidal y activated population ex vivo in a mammal (by allowing a tumour associated lipids are contact Aprs, in which receptors for the tumour associated lipids are daministering Aprs to the host), producing a tumour associated lipids to contact T cells, in which adaptor proteins, which inhibit T cell activated to produce a tumouricidal y activated or functionally deactivated to produce a tumouricidal population of T cells, and administering the tumouricidally activated T cells to the host). Contact T cells and administering the tumouricidally activated T cells to the host), cancer in a mammal (by administering a lipid in vivo), producing (MS) a tumouricidal T cell population in vivo in a mammal (by allowing a tumouricidal T cell population in vivo in a mammal (by allowing a tumouricidal T cell population in vivo in a mammal comprising allowing a tumouricidal T cell population in vivo in a mammal comprising allowing a cutoctionally deactivated or ontact immunocytes in vivo, The cutocrise which inhibit T cell activated or contact immunocytes in vivo at the cutouricidal antigen to contact immunocytes in vivo in a mammal contact immunocytes and cutocrise which inhibit T cell a proteoglycolipids are inactivated or tumours. Bacterial superantigens are co-administered or administered as fusion constructs with anti-tumour proteins or motifs. The present sequence represents an anti-tumour protein which is co-administered with was obtained in electronic format from the US patnet "seqdata.uspto.gov/sequence.html?DocID=20020177551" or incorporated into a fusion construct with a superantigen. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from the US patnet effice website at "sequata uspto.gov/sequence.html?DocID=20020177551" Sequence 174 AA;

The invention relates to a process for producing an outer membrane vesicle (OWV) preparation from a bacterium. The process involves distrupting the bacterial membrane substantially in the absence of deoxycholate detergent or other detergent, followed by several centrifugation steps. Membrane disruption is achieveded by several homogenisation, microfluidisation, cavitation, osmotic shock, grinding, French press, belnding or any other physical technique. The outer membrane vesicles can be prepared from bacteria of the genera Moraxella, Shigella, Pseudomonas, Treponema, Porphyromonas, Helicobacter or Neisseria, and are particularly produced from Neisseria meningitidis especially serogroup B) or Neisseria genorrhoeae. The invention also relates to a Neisseria meningitidis outer membrane vesicle composition in which the vesicles include the immunogens NapA (Neisserial surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The method is useful for manufacturing an outer membrane vesicle preparation as a vaccine against Neisseria meningitidis serogroup B. The present sequence represents Neisseria meningitidis NspA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

The invention relates to an isolated reloided Neisserial surface procein alvention relates to an insolated reloided Neisserial surface procein in an alkalian also relates to the method of refolding an NspA protein; an alkalian erefolding buffer comprising ethanolamine and SB-12 (3-dimethyldodecylammoniopropanesulphoate) for refolding an NspA protein, a dimethyldodecylammoniopropanesulphoate) for refolding an NspA protein, a pharmaceutical composition comprising the refolded NspA protein, a carrier and optionally one or more other Neisserial antigens; a method of preventing or treating a Neisserial infection. NspA has constructeristics which indicate that it is a potential vaccine candidate for the development of subunit vaccines for the treatment of infections caused by Neisseria meningitidis (meningococcus), which causes invasive bacteraid diseases such as bacteraemia and meningitis, or Neisseria consorrhoeae, the causative agent of gonorrhoea. Recombinantly produced of NspA could therefore be used to produce vaccine compositions and it could also be used in the development of new antimircobial agents, diagnostic tests and in drug screening. However, recombinantly produced proteins are frequently unable to adopt their biologically active conformations, and yields may be very low due to mis-folding and aggregation of the protein. The method of the invention provides an improved method for refolding the possible to increase the recovery of active protein form partly purified inclusion bodies in amounts up to 100% without the need for further purification. The refolded NspA protein is useful for preparing a composition for diagnosing, treating or preventing infection caused by Neisseria meningitidis or Neisseria gonorrhoeae. The meningitidis H44/76.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FAVDYTRYKNYKAPSTPFKLYSIGASAIYDFDTQSPVKPYLGARLSLNRASVDLGGSDSF 120

The composition is useful for inducing an immune response against N. meningitidis, for preventing and/or treating N. meningitidis infection and for treating and/or preventing neisserial infection chosen from N. meningitidis, N. gnoorthoae, N. lactamica and N. polysaccharea. It is useful for treatment or prophylaxis of meningitis and meningoccaemia, in a host. The host is a mammal, preferably a human and more preferably an adult human. The present sequence is the Neisseria meningitidis strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 FAVDYTRYKNYKAPSTDFKLYSIGASAIYDFDTQSPVKPYLGARLSLNRASVDLGGSDSF 120

```
The present invention relates to a pharmaceutical composition comprising a liposome associated with an isolated polypeptide derived from Neisseria meningitidis strain 608B, where the polypeptide is the NBA protein. The composition is useful for inducing an immune response against N. meningitidis, for preventing and/or treating N. meningitidis infection and for treating and/or preventing neisserial infection chosen from N. meningitidis, N. gonorrhoeae, N. lactamica and N. polysaccharea. It is useful for treatment or prophlylaxis of meningitis and meningoccaemia, in a host. The host is a mammal, preferably a human and more preferably an adult human. The present sequence is a modified version of the Neisseria meningitidis strain 608B NSpA protein. Note: This sequence is not shown in the specification but has been created based on the information given and the wild-type NSpA protein shown in Figure 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Composition comprising liposome associated with isolated polypeptide or polymucleotide derived from Neisseria meningitidis strain 608B, or its fragment or analog, useful for inducing an immune response against N. meningitidis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 MKKALATLIALALPAPAALAEGASGFYVQADAAHAKASSSLGSAKGFSPRISAGYRINDLR

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel composition comprising outer-membrane vesicles (OWV) prepared from a first strain of Neisseria meningitidis and 1 or more proteins which are present in OWVs prepared from a second strain of N. meningitidis, but which are not present in OWVs prepared from the first strain. The composition of the invention demonstrates antibacterial and antihilammatory activities and may be useful in the field of meningococcal biochemistry, in particular the trafficking and localisation of meningococcal infections, as well as in the prevention or treatment of meningococcal infections, possibly via the production of a vaccine or gene therapy. The current sequence is that of a Neisseria meningitidis MCSB outer-membrane vesicle (OWV)-related membrane protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FAVDYTRYKNYKAPSTDFKLYSIGASAIYDFDTQSPVKPYLGARLSLNRASVDLGGSDSF 120

The isolated 22 kD antigen, antigents of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. genorrhoase in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)

```
A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT33039 to AAT39042). The isolated 22 kD antigen, antigent fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen may so be used to detect antibodies or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)

```
A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39939 to AAT39042). The isolated 22 kD antigen, antigenic fragments of antibodises can be used in a vaccine for the prevention of infection by N. meningitidis or by N. genorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis antigen. DNA sequences encoding the antigen, or their fragments, can be used as probes for the detection of pathogenic Neisseria bacteria. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                              Neisseria meningitidis antigen, highly conserved between different
strains - useful for prodn. of antibodies for immunisation against,
diagnosis of, N. meningitidis infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a new gram-negative bacterial bleb presenting on its surface the PorB outer membrane protein from Chlamydia trachlomatis, or a protective antigen from C. pneumoniae. The invention is useful for preventing C. trachomatis or C. pneumoniae infection in a host. The present amino acid sequence represents a Neisseria gonorrhoeae protein as described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FAVDYTRYKNYKAPSTDFKLYSIGASAIYDFDTQSPVKPYLGARLSLNRASVDLGGSDSF 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a pharmaceutical composition comprising. a liposome associated with an isolated polypeptide derived from Neisseria meningitidis strain 608B, where the polypeptide is the NspA protein. The composition is useful for inducing an immune response against N. meningitidis, for preventing and/or treating N. meningitidis infection meningitidis, N. gonorrhoeae, N. lactamica and N. polysaccharea. It is useful for treatment or prophylaxis of meningitis and meningoccaemia, in a host. The host is a mammal, preferably a human and more preferably an adult human. The present sequence is a modified version of the Neisseria meningitidis strain 608B NspA protein. Note: This sequence is not shown in the specification but has been created based on the information given
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               FAVDYTRYKNYKAPSTDFKLYSIGASAIYDFDTQSPVKPYLGARLSLNRASVDLGGSDSF 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABPR1016-ABPR1046 represent nucleic acid molecules of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 FAVDYTRYKNYK-APSTDFKLYSIGASAIYDFDTQSPVKPYLGARLSLNRASVDLGGSDS

Composition comprising liposome associated with isolated polypeptide or polymorcleotide derived from Neisseria meningitidis strain 608B, or its fragment or analog, useful for inducing an immune response against N. meningitidis.

Example 4; Page; 79pp; English.

The present invention relates to a pharmaceutical composition comprising a liposome associated with an isolated polypeptide derived from Neisseria meningitidis strain 608B, where the polypeptide is the Nmph protein. The composition is useful for inducing an immune response against N. meningitidis, for preventing and/or treating N. meningitidis infection and for treating and/or treating neisserial infection chosen from N. meningitidis, N. gonorrhoeae, N. lactamica and N. polysaccharea. It is useful for treatment or prophylaxis of meningitis and meningoccaemia, in a host. The host is a mammal, preferably a human and more preferably an adult human. The present sequence is a modified version of the Neisseria meningitidis strain 608B NspA protein. Note: This sequence is not shown in the specification but has been created based on the information given and the wild-type NspA protein shown in Figure 1.

Sequence 7922, Application US/09543681A

Patent No. 6605709

GENERAL INFORMATION:

APPLICATION:

TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS

TITLE REFERENCE: 2709.1002-001

CURRENT PAPLICATION NUMBER: US/09/543,681A

CURRENT FILING DATE: 2000-04-05

PRIOR APPLICATION NUMBER: US 60/128,706

PRIOR PAPLICATION NUMBER: US 60/128,706

NUMBER OF SEQ ID NOS: 8344

SEQ ID NO 7922

LENGTH: 384
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GENERAL INFORMATION:

Nalternate names: outer membrane protein opak
Cispecies: Neisseria gonorrhoeae
A,Variety: strain MS11

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A) Experimental source: strain MSII, variant 4.8
A) Note: the authors translated the codon CCA for residue 32 as Thr
A) Note: the authors did not translate the sequence for the signal peptide
A) Note: expression of opacity proteins is regulated by the number of translated repeat of repeats place the start codon in frame with the rest of the protein

spacity protein-related protein OPM1 precursor - Neisseria meningitidis (strain C1938) (
NyAlternate names: outer membrane protein class 5
C;Species Neisseria meningitidis
A;Variety: strain C1938
C;Date: 19-Mar-1997 #sequence_revision 17-Oct-1997 #text_change 09-Jul-2004

RESULT 15

KONH2C opacity protein P.IIc precursor - Neisseria gonorrhoeae (strain JS3) (fragments)

RESULT 14

```
opacity protein opaH precursor - Neisseria gonorrhoeae (isolate 15063G)
N.Alternate names: cell invasion protein opaH
C.Species: Neisseria gonorrhoeae
A.Variety; isolate 15063G
C.Paccession: S7243
C.Accession: S7243
A.Title: The opaH locus of Neisseria gonorrhoeae MS11A is involved in epithelial cell in A.Title: The opaH locus of Neisseria gonorrhoeae MS11A is involved in epithelial cell in A.Paccession: S72343
A.Title: The opaH locus of Neisseria gonorrhoeae MS11A is involved in epithelial cell in A.Paccession: S72343
A.Accession: S72343
A.Accession: S72343
A.Accession: S72343
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A) Residues: 1283 4WAL>
